

Data Structures and Algorithms - Assignment 1

1. Write all possibilities to check palindrome. Also do time and space complexity analysis.
2. Write a linear search algorithm to return index of last occurrence of key.
3. Write a program to print no. of comparisons done to search a key in i. linear search ii. binary search
4. Create array of employees and search employee by i. empid ii. name iii. salary
5. Implement binary search algorithm if array is sorted in descending order.
6. Implement linear search algorithm to find the nth occurrence of the given element. If nth occurrence is not found, return -1.
7. find the first non-repeating element: Input: { 1, 2, 3, -1, 2, 1, 0, 4, -1, 7, 8 } Output: 3
8. to find rank of an element in a stream of integers. rank: rank of a given integer "x", in stream is "total no. of ele's less than or equal to x (including x).
Input: { 10, 20, 15, 3, 4, 4, 1 } Output: Rank of 4 is: 4
9. Write a selection sort function to sort array and return no. of comparisons.
